SHOWER DOOR HARDWARE

MAINTENANCE GUIDELINES

The Do's:

- To maintain the hardware, the best method is to dry it with a clean, soft towel on a regular basis (i.e., at least once daily).
- If you discover mineral deposits, use a mild liquid soap and mix with warm water. Then, be sure to use a soft, non-abrasive cloth (e.g., a microfibre cloth) to clean the hardware. Rinse thoroughly with clean, warm water and dry the hardware.
- If the hardware requires lubrication, apply a drop of general-purpose lubricating oil ("household oil") on the white nylon washer on the pivoting portion of the body of the hardware. Should the hardware be disassembled, use white lithium grease to lubricate the interior mechanism upon re-assembly.

The Don'ts:

- **NEVER** use an abrasive cleaner on the hardware. The damages to the hardware will be irreparable if it comes into contact with harsh, abrasive chemicals. The reason is that the hardware is coated with a finish (either plated or painted).
- Do **NOT** use spray lubricant on the hardware. If lubrication is required, please refer to our instructions above in The Do's section.
- Do **NOT** clean the hardware with any chemical liquids.
- Keep hardware **away** from any kind of acidic and corrosive material.
- Do **NOT** install the hardware in a corrosive environment.
